1. WYSIWYG Editing In Apache Forrest

This plugin provides *WYSIWYG* editing for the Apache Forrest application. It currently only works with HTML input files, but we hope to extend its range of supported file formats.

This plugin uses [HTML Area](#) for the editing widget.

1.1. Try it out

2. How do I allow users to edit my Pages?

If a request is recieved with an URL that contains "edit_htmlArea/" then an edit page is generated for the indicated page. For example:

```
@lt;a href="/edit_htmlArea/index.html"@gt;edit index</a>
```

will create an editor for the `index.html` page.
