XML::Xerces Sample: DOM2Hash

Table of contents

1. Sample: DOM2Hash

1.1. DOM2Hash

DOM2Hash, illustrates how to traverse a DOM tree in memory and convert that tree to a simple recursive hash table data structure.

1.1.1. Running DOM2Hash

The DOM2Hash sample illustrates how convert a DOM tree to another format. To run DOM2Hash, enter the following

```
perl DOM2Hash.pl  <XML file>
```

Here is a sample output from DOM2Hash

```
perl DOM2Hash.pl roles.xml

$VAR1 = {
          'node_name' => 'contributors',
          'children' => [
                          {
                            'node_name' => 'person',
                            'attributes' => {
                                              'Role' => 'manager'
                                            }
                          }
                        ],
          'attributes' => {
                            'xmlns' => 'contributors'
                          }
        };
```
