1 Overview..... 2

1. Overview

Which is a simple environment checking utility that focuses on reporting the versions of various XML interfaces and some common Apache projects.

Currently, most of the documentation about Which is in it's Javadoc, which you can build via `build docs`.

FIXME (curcuru):

Still need to write overview and user guide docs, as well as guidelines for creating WhichProject implementations and best practices about how to use Which for customer support or automated tools.
